This report is printed on recycled paper

This report, prepared by the Delaware Valley Regional Planning Commission, was financed by the Federal Highway Administration and the Federal Transit Administration of the U.S. Department of Transportation, and the Pennsylvania and New Jersey Departments of Transportation. The authors, however, are solely responsible for its finding and conclusions, which may not represent the official views or policies of the funding agencies.

Created in 1965, the Delaware Valley Regional Planning Commission (DVRPC) is an interstate, intercounty and intercity agency which provides continuing, comprehensive and coordinated planning for the orderly growth and development of the Delaware Valley region. The region includes Bucks, Chester, Delaware, and Montgomery counties, as well as the City of Philadelphia, in Pennsylvania; and Burlington, Camden, Gloucester, and Mercer counties in New Jersey. The Commission is an advisory agency which divides its planning and service functions between the Office of the Executive Director, the Office of Public Affairs, and four line Divisions: Transportation Planning; Regional Planning; Regional Information Services Center; and Finance and Administration. DVRPC's mission for the 1990s is to emphasize technical assistance and services, and to conduct high priority studies for member state and local governments, while determining and meeting the needs of the private sector.

The DVRPC logo is adapted from the official seal of the Commission and is designed as a stylized image of the Delaware Valley. The outer ring symbolizes the region as a whole while the diagonal bar signifies the Delaware River flowing through it. The two adjoining crescents represent the Commonwealth of Pennsylvania and the State of New Jersey. The logo combines these elements to depict the areas served by DVRPC.

DELAWARE VALLEY REGIONAL PLANNING COMMISSION

Publication Abstract

TITLE	Date Published: April, 1995
2020 Zonal Population and Employment Forecasts Direction 2020 Report # 25	**Publication No.** 95003

Geographic Area Covered:

All Traffic Analysis Zones in the Delaware Valley Region, including Boyertown Borough, Colebrookdale Township, and Douglass Township in Berks County.

Key Words:

Population, Occupied Housing Units, Vehicle Availability, Employed Residents, Employment, and Employment by Standard Industrial Sector .

ABSTRACT

This report documents Years 2000, 2010 and 2020 forecasts of Traffic Analysis Zonal socio-economic data, and the related forecasting methodology. These zonal data are among the direct inputs to the DVRPC regional travel-demand simulation models, which are used to estimate travel patterns, facility volumes, and emissions generated by mobile sources.

I. Introduction

Demographic and employment Traffic Analysis Zone (TAZ) forecasts are among the basic direct inputs for DVRPC's regional travel-demand simulation models. These models are used to estimate regional travel patterns, travel-demand on individual facilities, transit ridership, highway vehicle miles of travel and highway source air pollutant emissions. The forecasts are essential for the development of short- and long-range transportation plans, conformity analyses of the transportation improvement program, facilities design studies as well as other planning activities.

This report documents the methods used in forecasting zonal population, occupied housing units, vehicle availability, employed residents, and employment. The zonal forecasts are strictly controlled by the municipal or county planning area forecasts adopted by the Board of Directors of the Delaware Valley Regional Planning Commission, documented in Reports 8 and 15 in the Direction 2020 series.[1] The resulting zonal forecasts are arranged by variable in the first parts of appendices A through D. The aggregated totals for the same variable by county planning area and county are tabulated in the second parts of those appendices. For each variable, the 1990 Census counts and 2000, 2010 and 2020 forecasts are listed for comparison. One exception is that the forecasted zonal sector employment are not listed here. Instead, the forecasted 2000, 2010 and 2020 aggregated county-level sector employment are tabulated in Table 7.

The TAZ data from the 1980 and 1990 Census Transportation Planning Package--Urban Element are used as the historical base in the forecasting process. These zonal data are documented in the DVRPC data bank for transportation planning[2]. Since some of the 1980 TAZ boundaries have been changed for the 1990 Census, the 1980 and 1990 zonal data are not comparable in all cases. To achieve data comparability for forecasting purpose, the 1980 TAZ data are re-tabulated by the 1990 zonal system. For details of TAZ changes, refer to Chapter IV of this document.

The following sections of this report present the descriptions of the DVRPC's method in the forecasting process and the summary of the forecasting results at the county and regional level. Preliminary forecasts were prepared by DVRPC staff and subsequently evaluated by county planners from the point of view of local knowledge and plans. Their comments were incorporated into the estimates. As the future may not be a direct extension of past trends, these forecasts will be closely monitored and updated as necessary to maintain a comprehensive, coordinated and continuous planning process that provides the most accurate available information for decision making.

[2] *1980 Data Bank for Transportation Planning and Travel Simulation*, DVRPC, November, 1984; and *1990 Data Bank for Transportation Planning*, DVRPC, October, 1994.

II. Forecasting Methodology

The methodology for disaggregating the DVRPC Board adopted Year 2020 municipal forecasts into traffic zones (TAZ's) is based on the well-known shift-share method. For a given zone, the zonal share of population or employment is defined as the fraction determined by the zonal estimate of that variable divided by the appropriate municipal total. For example, the 1990 zonal population share can be computed as follows:

$$SP_{90} = \frac{PZ_{90}}{PM_{90}}$$

Where:

SP_{90}: 1990 population zonal share (the municipal sum of zonal shares equals 1);
PZ_{90}: 1990 zonal population for the given zone;
PM_{90}: the 1990 Census municipal (county planning area in Philadelphia) population.

In this forecast, it is assumed that a TAZ's 2020 share of a given variable is the 1990 base share plus a quarter of the share change that occurred between 1980 and 1990. This implies that the zonal share change that will occur in the following three decades will be moderate compared with the experience of the last decade. This assumption reflects a zonal non-linear growth pattern of population and employment. The following equation is applied to estimate the Year 2020's population zonal share for a given TAZ:

$$SP_{20} = SP_{90} + 0.25\,(SP_{90} - SP_{80})$$

Where:

SP_{80}: the 1980 zonal share;
SP_{90}: the 1990 zonal share;
SP_{20}: the forecasted Year 2020 zonal share.

The historical share trend plays a key role in projecting the year 2020's zonal shares. If the 1990 share is greater than 1980's, the 2020 share would be projected to grow compared with 1990, and vice versa.

The parameter "0.25" in the above equation was determined based on several experiments. Parameters 1.0, 0.5, 0.25, and 0.125 were tested, and 0.25 was judged to produce the most reasonable results.

Based on this extrapolated share, an initial estimate of the 2020 zonal forecast is computed as the product of the estimated zonal share (SP_{20}) and the appropriate Board adopted 2020 municipal forecast. However, some zones in the region have experienced substantial growth or decline in the last decade. In these cases, the above share forecasting methodology may exaggerate the trend. To mitigate excessive growth or decline trends, maximum 1990-to-2020 municipal growth and decline rates for population and employment are set for each county to restrict the 2020 zonal share forecasts. After the maximum growth and decline rates have been applied, some of the initial 2020

zonal forecasts are adjusted. Furthermore, for demographic forecasting, the growth rates of the zonal population, occupied housing units, and employed residents are computed and compared. To insure the consistency of growth or decline pattern across those related demographic variables, some zonal adjustments are made to these variables. As the result, the aggregated zonal totals may not equal the Board adopted municipal forecast. When this occurs, the 2020 zonal forecasts are factored, so that the aggregated zonal totals at the municipal or county planning area level equal the Board adopted 2020 forecasts.

With regard to the forecasting of zonal sector employment, since only county-level sector employment forecasts are available, this forecast assumes the 1990 zonal sector employment as a base. The future zonal sector employment will grow or decline at the same ratio as the zonal total employment. The initial zonal sector forecasts are factored up or down so that aggregated zonal totals at the county level are equal to the pre-forecasted county-level sector totals.

Years 2000 and 2010 Zonal Forecasts

The 2000 and 2010 zonal forecasts for population and employment are interpolated between the 1990 Census data and the Year 2020 zonal forecasts determined above. A slightly non-linear growth pattern is assumed to conform with the general trend of population and employment growth in the region. For instance, initial Years 2000 and 2010's zonal population (or employment) estimates are computed as follows:

$$P_{2000} = P_{1990} + 0.37(P_{2020} - P_{1990})$$
$$P_{2010} = P_{1990} + 0.69(P_{2020} - P_{1990})$$

Where P_{1990}, P_{2000}, P_{2010}, and P_{2020} denote the zonal population for years 1990, 2000, 2010, and 2020, respectively.

As in the 2020 zonal forecasts, these initial zonal estimates of population (and employment) for Years 2000 and 2010 are then factored to equal the DVRPC Board forecasts at the municipal / county planning area level.

Following the estimation of zonal population and employment, similar estimating procedures were used to forecast zonal occupied housing units, occupied housing units by vehicle availability, and employed residents. Total vehicles available for a given TAZ are computed from zonal occupied housing units by vehicle availability as follows:

$$V = H_{v1} + 2H_{v2} + 3.358H_{v3}$$

Where:

V: number of vehicles;
H_{v1}: Occupied housing units with one vehicle;
H_{v2}: Occupied housing units with two vehicles;
H_{v3}: Occupied housing units with three or more vehicles;

The factor 3.358 for three- or more-vehicle occupied housing units is based on 1990 census data.

One limitation of this forecast is the lack of detailed land use information regarding the zonal housing and employment development and land preservation plan. As a result, the extrapolation method may over-estimate the growth or decline for some zones at the cost of under-estimating the growth or decline of other zones within the same municipality. To compensate for this limitation, the adjustments made by the county planners based on reviewing the preliminary numbers have been incorporated into the final estimates listed in this report.

III. Summary of County and Regional Growth Trends

Population: the total number of inhabitants in a TAZ without regard to race, gender or any other social or economic variables. The 1990 original zonal population data are adjusted to municipal 100-percent counts in STF-3.

The region's population is forecasted to grow by 11.0 percent over the thirty-year period between 1990 and 2020. Compared with the 12.4 percent growth during the period from 1960 to 1990, this growth rate reflects the lower birth rate, aging population, and a slowdown in the region's economy and in-migration. Suburban and some rural areas will gain substantial population as new housing developments are built. The medium-to-small and older urbanized centers, such as Trenton, Camden, Chester City, and Pottstown, are forecasted to be stable with minor population growth or decline. The City of Philadelphia is expected to lose about 5 percent of its population because of job relocation and continued suburbanization. Table 1 shows the county-level forecasts for the entire region[3]. The New Jersey population is expected to grow more than three times as fast as Pennsylvania. Suburban counties (except Delaware) are predicted to grow at a double-digit rate in the thirty-year period. The zonal 1990-2020 percentage growth pattern is shown in Figure 1.

Occupied Housing Units: Living quarters are classified as either *housing units* or *group quarters*. A housing unit is defined as a house, an apartment, a mobil home or trailer, a group of rooms or a single room occupied as separate living quarters, or if vacant, intended for occupancy as separate living quarters. If the living quarters contain nine or more persons unrelated to the householder or person in charge (a total of at least 10 unrelated persons), it is classified as group quarters. A housing unit is classified as ***occupied*** if it is the usual place of residence of the person or group of persons living in it at the time of enumeration, or if the occupants are only temporarily absent; that is, away on vacation or business. Occupied rooms or suites of rooms in hotels, motels, and similar places are classified as housing units only when occupied by permanent residents. The number of 1990 occupied housing units is calculated from the table of Tenure by Vehicle Available.

The average household size has declined in the past decades. In this forecast, it is assumed that the decline in average household size will continue, but at a moderating pattern. As a result, the pace of growth in occupied housing units is forecasted to exceed the growth rate of population. Table 2 shows the regional and county level forecasts of occupied housing units. The region will grow in occupied housing units by about 17 percent from 1990 to 2020 (11 percent in population), reaching 2.21 million by the year 2020. The majority of the net gain will be concentrated in suburban areas, especially in new development areas. For most suburban counties the growth in occupied housing units will be significant, from 20 to 46 percent over the thirty year period between 1990 and 2020. Figure 2 shows projected spatial pattern of the zonal percentage growth for the same time period.

Occupied Housing Units by Vehicle Availability: Each data category shows the number of households with the specified number of passenger cars, vans and pickup or panel trucks of one-ton capacity or less, available for the use of household members. Vehicles rented or leased for one

[3] The aggregated county forecast totals presented in tables 1 through 6 may slightly differ from those county forecast totals published in Report 15 of the Direction 2020 as the result of rounding in the forecasting process discussed in Chapter II.

month or more, company vehicles, and government vehicles are included, if kept at home for non-business purposes. The 1990 data are estimated based on the household sampling distribution.

With rising household labor participation rates and continued decentralization of population and employment into auto-dependent area, the number of households with two vehicles or more has grown at a double-digit rate while the number of households without a vehicle or with one vehicle has stabilized in the last decade. In this forecast, it is assumed that this trend will continue at a moderating rate, in association with the growth of population and occupied housing units. The growth rates in occupied housing units with two or three or more vehicles will taper off with a reduction in the average household size and stabilization of labor participation rate. The households without a vehicle or with one vehicle are forecasted to be stable at the 1990 level.

As shown in Table 3, at the regional level, households with no available vehicle are projected to drop by only 1.2 percent, while households with one-vehicle are projected to be stable in the thirty-year period. Over the same time interval, households with two vehicles and three or more vehicles are projected to increase by 32 and 46 percent, respectively. The rate of growth in multiple vehicle households is significantly higher in the New Jersey portion of the region.

Total Vehicle Availability: These data are calculated from occupied housing units by vehicle availability data. Each category (one-vehicle households, two vehicle households, etc.) is converted into number of vehicles available for that category by multiplying the vehicle availability and the number of occupied housing units, and then summing across all categories to get the total vehicles available for households in a TAZ.

Based on the forecasts of the occupied housing units by vehicle availability class, the number of total vehicles is projected in accordance with the formula discussed above. As shown in Table 4, vehicle growth will be substantial, with all counties except for Delaware, Montgomery and Philadelphia increasing by more than 30 percent by the year 2020. The counties growing most rapidly in population (Gloucester and Chester) also grow fastest in the number of vehicles, 57 and 49 percent respectively. For the region as a whole, almost 29 percent more vehicles will be on the road in the year 2020. This is a net increase of almost 0.8 million vehicles from the 1990 level. Figure 3 displays the spatial pattern of zonal percentage growth for the DVRPC region.

Employed Residents: All civilians 16 years old and over who were either "at work" or "with a job, but not at work". "At work" refers to those who did any work at all during the census reference week as paid employees, worked in their own business or profession, worked on their own farm or worked 15 hours or more as unpaid workers on a family farm or in a family business. "With a job, but not at work" refers to those who did not work during the reference week, but had jobs or business from which they were temporarily absent, for whatever reason, in the census reference week. Also, persons who served in the United States armed forces are included regardless of whether or not they went to work during the reference week. The 1990 data are drawn from the Sex by Employment Status.

Because of the rising cost of living and expectation of an improved living standard in association with the prosperous perspective of employment opportunity in the region, the rate of employed residents per occupied housing units is expected to increase as households strive to maintain and enhance their purchasing power. However, this process is mitigated by the decline in

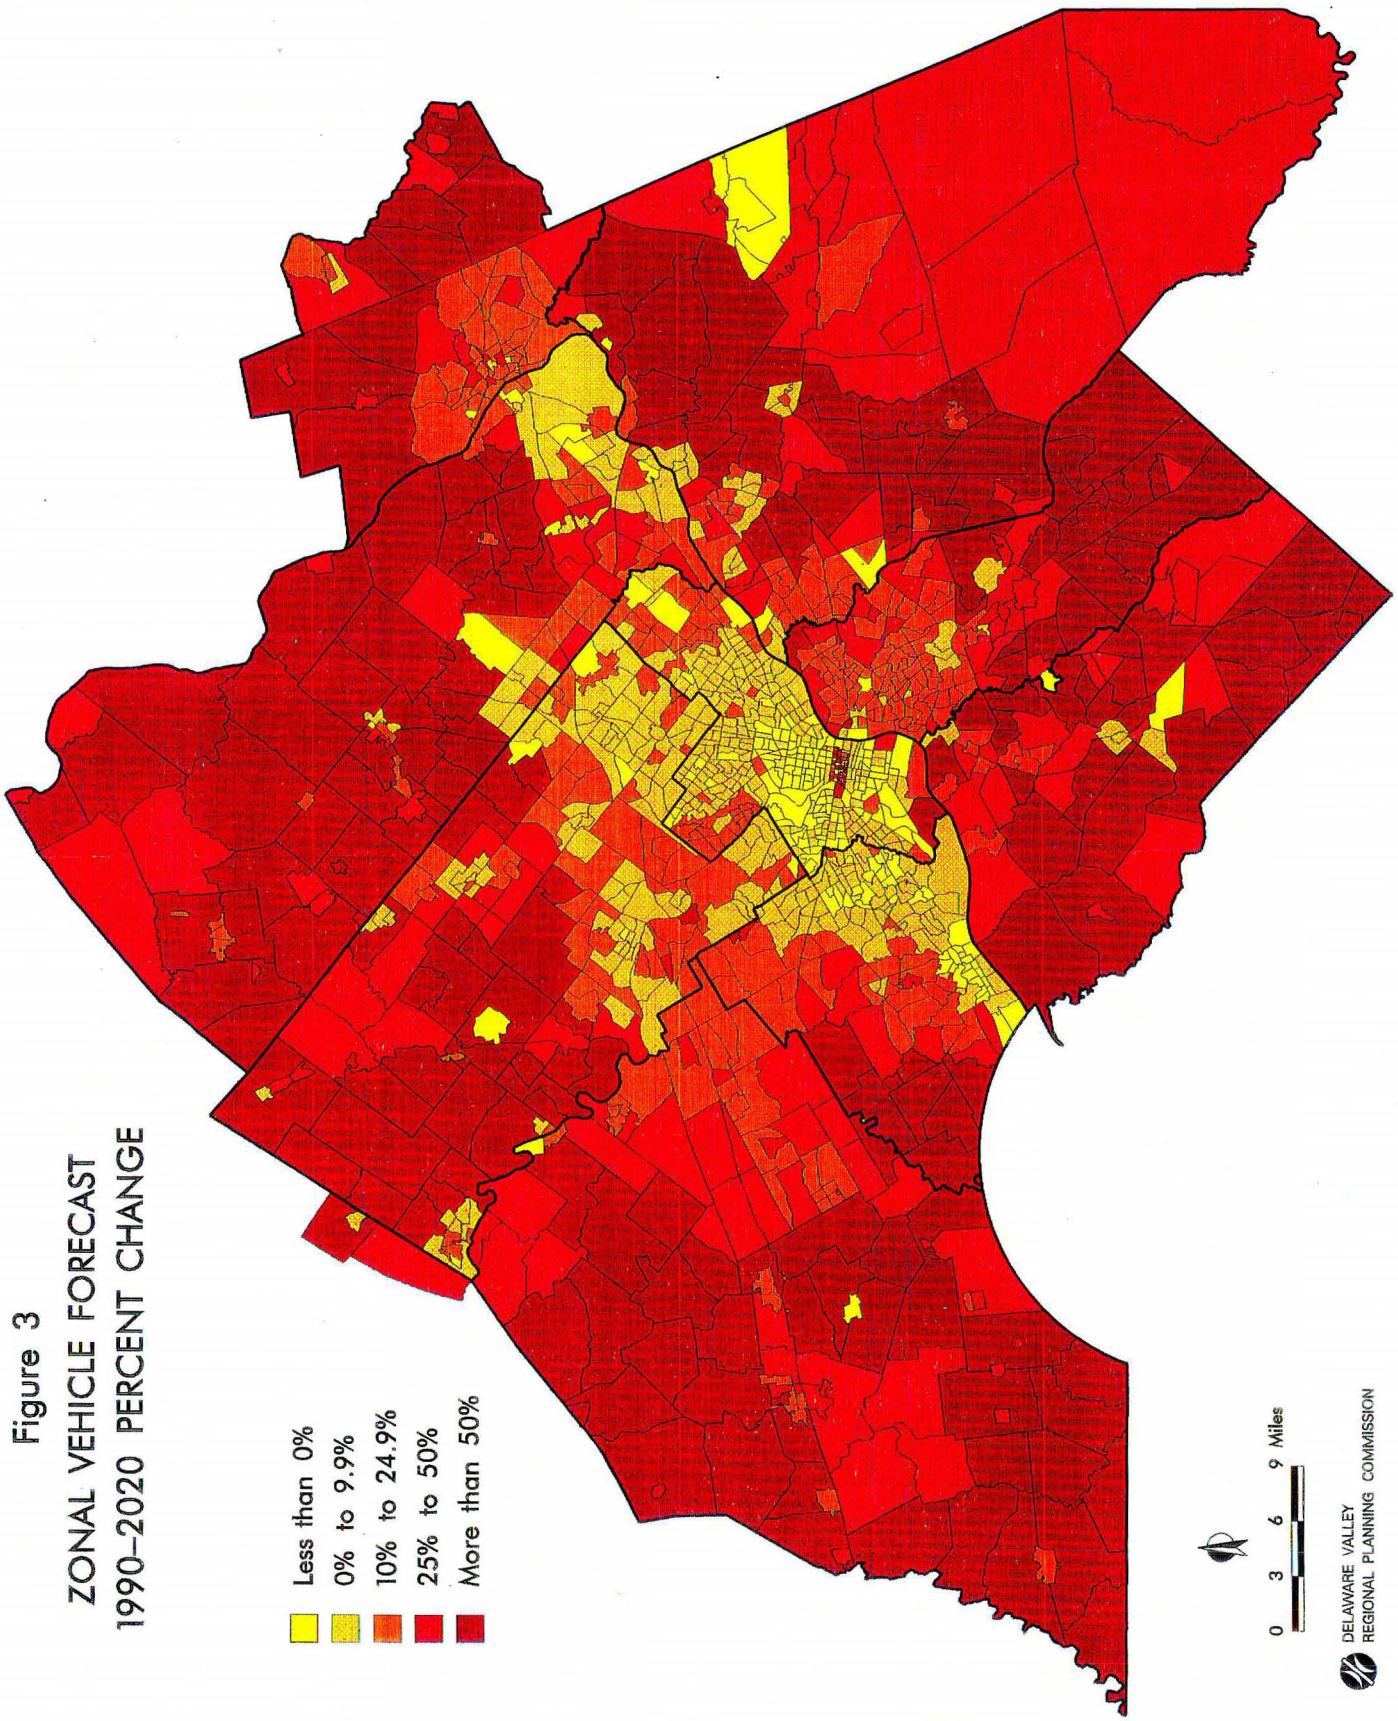

Figure 3
ZONAL VEHICLE FORECAST
1990–2020 PERCENT CHANGE

average size of occupied housing units, the increase in the percentage of population in the retirement age, stabilization of the labor participation rate among women, and increasing national productivity. In this forecast, the rate of employed residents per occupied housing unit is assumed to be stable with a slight increase in the thirty-year period.

For the region as a whole (as shown in Table 5), the total number of employed residents is expected to grow by about 20 percent from 1990 to 2020, a net increase of about half a million. It is expected that an one-percent growth of population will be associated with 1.8 percent growth in employed residents. This reflects the reduction in the average size of occupied housing units, long-term job growth and economic prosperity. On the other hand, the number of employed residents will grow at a rate almost identical to the adopted employment forecasts, 19.8 versus 20.0 percent by the year 2020. This is because the region is a comparatively closed system where almost all residents both live and work. Also, the number of people who live inside and work outside the region is approximately equal to the number of people who live outside and work inside. Of the net increase, 57 percent will be located in Pennsylvania, and 43 percent in New Jersey. The eight suburban counties will receive 99 percent of the net increase in employed residents. Figure 4 shows zonal growth pattern of employed residents for the entire DVRPC region.

Employment: Unlike demographic variables, employment is tallied by place of work, and as such it measures the number of jobs within a given TAZ.

The employment sectors contained in the report are listed below:

1. Agriculture, Forestry and Fisheries
2. Mining
3. Construction
4. Manufacturing
5. Transportation, Communications and other Public Utility
6. Wholesale Trade
7. Retail Trade
8. Finance, Insurance and Real Estate (FIRE)
9. Service
10. Government
11. Armed Forces

Employment is more difficult to forecast. The regional and county level employment is subject to national monetary policy and politics, world trade, and even global economic cycles. Meanwhile, the municipal and TAZ level employment is also subject to the local political climate, land price, quality of labor force, labor supply, infrastructure, and other factors.

In 1992, county employment was forecasted using Bureau of Economic Analysis (BEA) data for the base year 1990. In 1993, the 1990 employment data from the Census Transportation Planning Package (CTPP) became available. However, this data set under-estimated the number of jobs for a given geographic area, because it only counted the employed residents who made the works trips during the census reference week, employed residents who had at least a job in the week, but did not go to their regular employment places due to business trips or vacation, and personal or sick leaves were not counted at their employment zones or municipalities. The advantage of this data set

REGIONAL PLANNING COMMISSION

over the BEA 1990 estimates is that it has census tract or TAZ level employment estimates by Standard Industrial Classification (SIC). Therefore, the original 1990 census employment by SIC was adjusted to conform with the BEA estimates of total employment at the county level, and further reviewed for consistency with previous DVRPC forecasts, occupational privilege tax returns, Dunn and Bradstreet estimates and Bureau of Labor Statistics ES-202 data. The forecasts of municipal total employment and sector employment at the county level were then made with shift-share analysis methods using the adjusted 1990 Census data as a base.

Table 6 shows the employment growth for the region and by county. The region's employment is projected to grow by 20 percent, associated with about a 10 percent growth in labor supply over the three decades between 1990 and 2020. The counties with the fastest growing populations, such as Chester and Gloucester, are also projected to grow most rapidly in employment. However, the counties with a large employment base still gain the most employment, despite a more moderate growth rate. Table 7 lists the 2000, 2010 and 2020 county-level sector employment, which was determined based on a review of past trends and growth patterns both nationally and locally. Figure 5 presents the projected spatial pattern of percentage growth of zonal employment between 1990 and 2020.

REGIONAL PLANNING COMMISSION

IV. REGIONAL AREAL SYSTEM

The 1990 zonal Census data and all zonal forecasts are tabulated for two levels of the 1990 areal system. The first is traffic analysis zone (TAZ) defined by 1990 census tracts, or in some cases by 1990 block groups. The second level is the county planning area (CPA), which represents aggregations of TAZs and usually comprises several municipalities within a county.

The 1990 traffic analysis zonal system is developed from the 1990 census tracts and the 1980 TAZs. The 1990 census geographic coding splits many 1980 TAZs which were 1980 Census Tracts into two or more parts to reflect the growth of population and employment in some suburban and rural areas of the region. DVRPC's 1990 traffic analysis zones have been updated to reflect these changes. The 1990 TAZ system retains the block group designation in the Philadelphia CBD where 12 census tracts are subdivided into 54 TAZs based on one-to-one correspondence between 1980 *block group* and TAZ. In addition, combinations of 1990 block groups are used as 1990 TAZs in selected suburban areas of the region that are growing rapidly (principally in Camden and Burlington counties).

In 1990, the region was expanded to include three municipalities in Berks County, PA., and was subdivided into a total 1395 TAZs compared with 1335 zones in 1980. Except for three additional zones in Berks County, the increase in the number of TAZs is due to the split of 1980's census tracts and the subdivision of seven suburban 1990 census tracts into aggregates of block groups. As a result, the 1980 data for some zones may no longer be directly comparable with their counterparts of 1990 zones; although for the majority of zones the 1990 data can be directly compared with the 1980's.

A total of 37 of the 1980 TAZs were split into two or more 1990 TAZs. Table 8 (shown on page 25) documents the correspondence of these zones after splitting. This table is sorted by the 1980 TAZs, so that users can easily find the 1990 zones which together cover the same area as their 1980 predecessors. Also, the 1980 and 1990 census tract numbers and municipal and county names are included in this table. Of the split 1980 zones, 30 were divided in accordance with the census splits of 1980 census tracts and the new 1990 TAZs were created based on the one-to-one correspondence between 1990 tract and TAZ. In Table 8, the Block Group column for these TAZs are left as blank, since the whole 1990 tract is included in the corresponding 1990 TAZ. The seven suburban 1990 tracts that were subdivided into block groups have the detailed 1990 block group to 1990 TAZ correspondence shown in Table 8.

As 1990 TAZ's can always be aggregated to form 1980 TAZ boundaries, one way to make the 1980 and 1990 traffic zonal data comparable is to tabulate the 1990 data by 1980 TAZ. This can be accomplished by aggregating the 1990 zonal data into the corresponding 1980 zones using the correspondence shown in Table 8. It is much more difficult to tabulate 1980 Census data by 1990 TAZs as a census block level correspondence is required. This block level correspondence exists in DVRPC's files, but is much too large to include in this report. The zonal forecasting process was initiated to tabulate the 1980 census data by the 1990 zonal system for shift-share analysis.

Since the boundaries of County Planning Areas 1 through 71 have not been altered, all county planning area data included in this document are comparable with existing tabulations based on 1980

traffic zones. CPA 72 is newly created for the three municipalities in Berks County, PA.

Table 9 presents the overall correspondence between county, county planning area and the 1990 TAZ for the entire DVRPC region. This correspondence has been used to aggregate the 1990 and forecasted zonal data into the county planning area and county level summaries included in this document.

Traffic Analysis Zonal Maps 1 thru 10 for each county and county planning area map (Map11) for the DVRPC region are included on pages 43 thru 63.
